# Report

A **Report** entity stores the output generated by running a custom report program across one or more spatial datasets within a defined region of a project.

---

**Key Uses for Reports:**

- Volume change calculations
- Material distribution summaries
- Geospatial audits and compliance checks
- Custom analytics over selected project regions

Each report is created by executing a Python-based **report program** against a specified region and source dataset(s).

---

To learn how to create a new Report, please refer to the **Creating a Report** section.
