View

A **View** entity stores a pre-configured visualization composed of one or more spatial datasets. Views allow team members to quickly share meaningful scenes, insights, and spatial analyses across a project.

Why Use Views?

- Share complex spatial insights in an intuitive format
- Combine multiple datasets into a single visual context
- Enable consistent visualizations across teams
- Quickly iterate and refine scenes before saving or sharing

To learn how to create a new View, please refer to the **Creating a View** section.
